Hi Matt,

David and Nancy here with a couple of responses to your incoming inquiries.

Q: Have test results been received on the 282 private wells in CO and 114 in New Mexico? (In other words, after testing a combined 396, have ya'll found just 7 with initial exceedances and two with confirmed exceedances? Or is that 2 out of original 105?)

A: Yes. The total is 396 for two states. Seven had initial exceedances and two had confirmed exceedances.

Q: What were the levels of arsenic, iron and manganese?

A: Information regarding private domestic well sampling is provided directly to well owners and is not being released to the public.
